

Lyme Disease

What you need to know

Not everyone gets a rash from an infected tick bite

You can be bitten by an infected tick during any season

There is no established minimum time that a tick needs to be attached to transmit infection

Infected ticks have been found in every county in the UK

Lyme disease can be difficult to treat if not diagnosed early

Birds, mice and squirrels can carry infected ticks

Blood tests cannot rule out Lyme disease. Sometimes a clinical diagnosis is needed

Treatment should be started early for the best chance of success

Lyme disease can mimic other conditions including MS, CFS, Fibromyalgia and Alzheimer's

Botanic Protect®

Campaign Partner 2022

Effective plant-based tick repellent for all the family (babies from 6 months+). For more information visit botanicprotect.co.uk
